No provision has been made for site handling of stone units. Forticrete should be informed of any lifting requirements. Stone units may include lifting sockets for handling purposes during manufacture. It should not be assumed these are suitable for use on site. Site handling and installation of stonework is the responsibility of the principal contractor and should be given early consideration in consultation with an engineer. Unit weights are generally shown on drawings issued by Forticrete, or are available on request. All restraint/fixing requirements are to be specified by a structural engineer. This detail is supplied for information only and must be approved by the architect.
